

Coverity Static Analysis

Coverity is an accurate and comprehensive static analysis and static application security testing (SAST) solution that finds critical defects and potential security vulnerabilities in code as it's written

Overview

Coverity Static Analysis helps reduce risk and lower overall project cost by identifying critical quality defects and potential security vulnerabilities during development. It provides reliable, actionable remediation guidance based on patented techniques, a decade of research and development, and analysis of trillions of lines of proprietary and open source code.

Actionable remediation guidance enables developers to address potential security vulnerabilities quickly.

Key features

Depth and accuracy of analysis

- Coverity integrates seamlessly with any build system and generates a high-fidelity representation of the source code to gain a deep understanding of its behavior.
- Coverity provides full path coverage, ensuring that every line of code and every potential execution path is tested. It uses multiple patented techniques for deep, accurate analysis.
- Through a deep understanding of the source code and the underlying frameworks, Coverity provides highly accurate analysis results so developers do not waste time on a large volume of false positives. This enables them to build security into the development life cycle at the speed of agile CI/CD workflows.

Address security at the source

- Arm your developers with the information they need to troubleshoot and fix critical defects quickly and efficiently.
- Build quality and security into development to reduce the cost of rework and delayed time to market resulting from defects found late in the cycle.
- Reduce the risk of costly and brand-damaging software failures and security breaches in the field or in production.

Speed and scale of analysis

Coverity was built from the ground up to fit into any existing workflow, with the following capabilities:

- Parallel analysis allows Coverity to run on up to 16 cores simultaneously and delivers up to a 10X performance improvement over serial analysis.
- Fast Desktop Analysis and Incremental Analysis accelerate analysis by reanalyzing only code that has changed or been affected by a change, instead of the entire codebase each time. File system capture enables analysis of uncompiled code without having to do a full build first.
- Coverity scales to accommodate thousands of developers in geographically distributed environments and can analyze projects with more than 100 million lines of code with ease.

Software development life cycle (SDLC) integration

- Coverity can be rapidly integrated with critical tools and systems that support the development process, such as source control management, build and continuous integration, bug tracking, and application life cycle management (ALM) solutions, as well as integrated development environments (IDEs).
- The open platform allows developers to import third-party analysis results into the workflow to view and manage all types of defects in the same way, with a single view of software defects and risks.

Efficient issue management and remediation

- With Coverity Connect, the platform's collaborative issue management interface, developers get actionable information and precise remediation guidance, which shows them the right way to fix a defect and the best place in the code to fix it without requiring deep security domain expertise. Synopsys eLearning customers can also see links to relevant courses associated with specific CWEs found in their code to get better insight into vulnerabilities and immediate security training when they need it.
- Coverity Connect provides source code navigation to highlight the exact path to a defect and automatically identify every occurrence of the defect across shared code.
- Defects can be automatically assigned to the appropriate developer for resolution, and users can quickly view all outstanding issues related to security, OWASP Top 10, CWE, and PCI DSS, as well as quality, MISRA, CERT C/C++, and AUTOSAR.

Expanded standards compliance and vulnerability detection

Coverity Extend is an easy-to-use software development kit (SDK) that allows developers to detect unique defect types. The SDK is a framework for writing program analyzers, or checkers, to identify custom or domain-specific defects. Coverity CodeXM is a domain-specific functional programming language that enables developers to develop their own custom checkers easily. These customized checkers support compliance with corporate security requirements and industry standards or guidelines.

Synopsys is proud to serve the open source community, with more than 4,000 projects currently using our free Coverity Scan, including Linux, Python, PostgreSQL, Firefox, OpenSSL, Perl, Apache Hadoop, and many more.

Ability to drive adoption and mitigate risk

With Coverity Policy Manager, you can define and enforce consistent standards for code security as well as quality and testing across development teams. It provides visibility into which teams, projects, and components are compliant with these standards and can create measurable stage gates based on predefined criteria regarding defects and testing. Using customizable views, you can select development metrics and thresholds that align with specific objectives for embedded, enterprise, and mobile applications.

With Coverity Policy Manager, users can easily monitor and report on statuses, risks, and trends.

SYNOPSYS[®]

Supported languages and frameworks

Node.js

Fortran

VB.NET

Scala

iOS

Ruby

- C/C++
- C#
- Java
- Android
 Swift
- JavaScript
- PHP
- Python
- ASP.NET
- Objective-C
- JSP

Supported platforms

- Windows
 AIX
- Linux
- HP-UXNetBSD
- Mac OS X
- Solaris
 FreeBSD

SDLC integration

SCM

- AccuRev
- Apache Subversion (SVN)
- CVS
- Git
- Mercurial (Hg)
- Perforce Helix
- Team Foundation Server SCM

IDE/CI

- Android Studio
- Eclipse
- · IBM Rational Team Concert
- IntelliJ IDEA, WebStorm, RubyMine, PhpStorm, PyCharm
